MARKET RESEARCH · CASE EXAMPLE

Consumer Lifecycle Segmentation

A brand-relationship segmentation with a third-party audience append — sizing acquisition, retention, and reactivation.

Illustrative, white-labeled sample output. Based on a real engagement with all brand, platform, and client identifiers removed and the category generalized. Structure and method are real; figures are sample or anonymized.

The framework

Every respondent is placed into one of seven mutually exclusive brand-relationship states, each sized as a share of the base. A third-party consumer-data append then layers audience segments on top, so each state can be profiled and targeted.

Loyal — current, committed	18%
Switcher — current, low commitment	12%
Winback — former customer, addressable	9%
Lapsed — former customer, drifted	11%
Prospect — never a customer, open	22%
Rejecter — aware, unwilling	20%
Unaware	8%

Sample sizing shown for illustration; each state carries its own base (N) and is re-read within audience cuts.

How it drives decisions

- **Size the opportunity** — how much of the base is Winback or Prospect versus locked-in Loyal or hard Rejecter.
- **Prioritize spend by state** — retention on Switchers, reactivation on Winback, acquisition on Prospects.
- **Hand marketing an activation map** — which appended audiences over-index inside each high-value state.

Why it matters

Allocating a fixed marketing budget across acquisition, retention, and reactivation with evidence rather than instinct. The relationship states turn a flat audience into a prioritized, addressable map.
